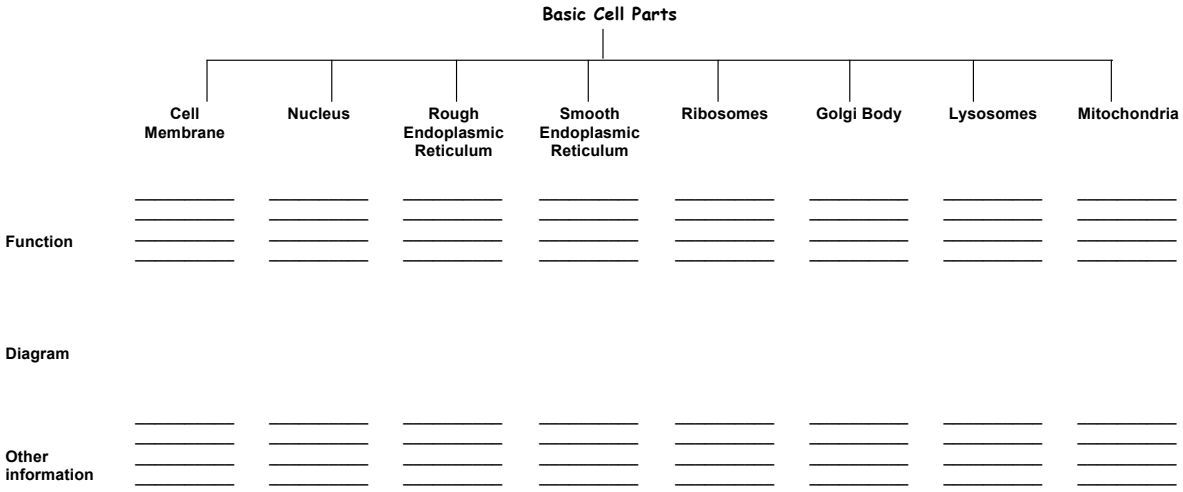
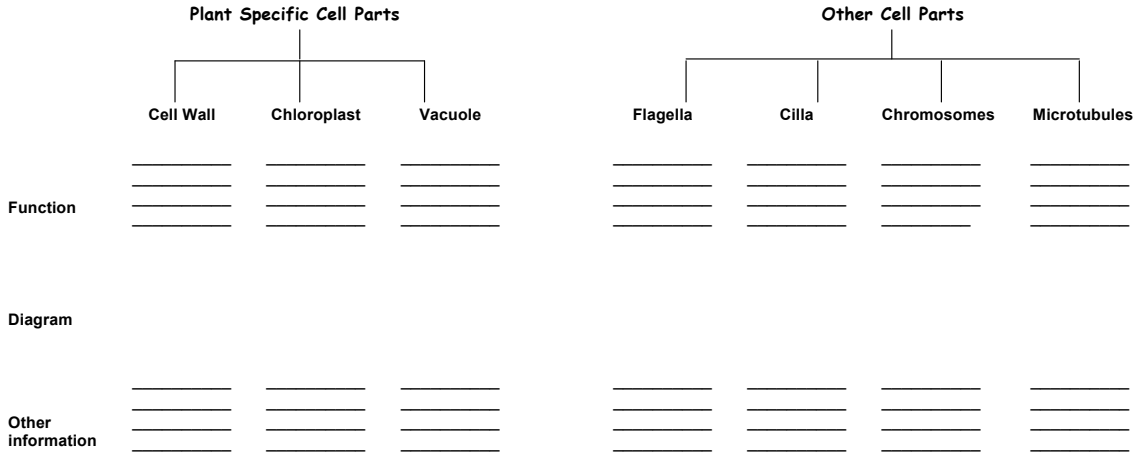
Cell Parts Tree Map




Using your own paper, construct the three tree maps below on the parts to a cell. The "basic cell parts" map is large and may take more than one paper (you will tape the map together to make it one continuous map). This paper is your guide on what your map should look like and what information it must contain. For the "other information" section, include important information such as what types of cells contain a lot of the organelle or if the organelle is found in particular types of cells, things that make the organelle unique, or other information about the organelle that does not fit in the function section.
